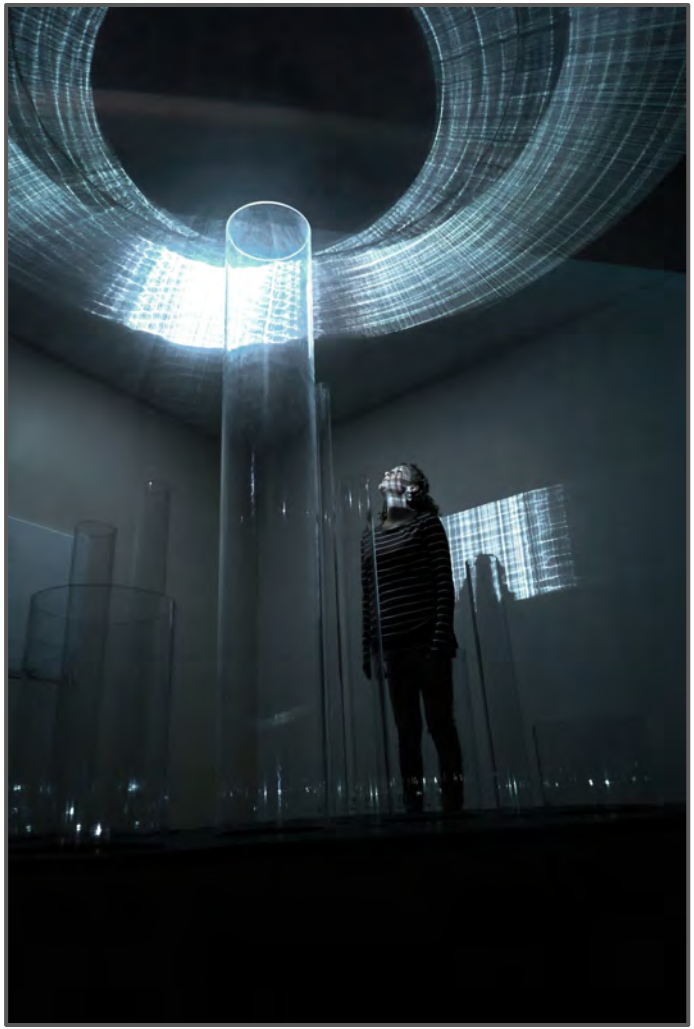
CAUSTIC BALLET

Light installation

An immersive light installation transforming projected light into moving caustic patterns.

indoor touring work.
Concept / Design: Joan Giner
Sound creation: Jérôme Villeneuve



CAUSTIC BALLET

Perception

Caustic Ballet transforms an ordinary optical phenomenon into a spatial experience.

The installation creates a suspended environment where light behaves as a moving presence. Lines, halos and luminous traces drift across the surrounding architecture, shifting with the slow rhythm of the projection.

The work slows down perception and reveals a fragile layer of reality that usually remains unnoticed: the hidden geometries produced by water, glass, reflections and curved transparent surfaces.

By expanding these discreet light events to the scale of a room, *Caustic Ballet* invites the audience to observe how simple physical phenomena can transform the experience of space.

CAUSTIC BALLET

Light principle

Transparent volumes

The installation is built around a cluster of transparent plexiglass tubes arranged as a sculptural composition.

Projected light

A slow light sequence passes through the transparent structure. As the light crosses the curved surfaces, it is fragmented, stretched and redirected.

Expanded architecture

The resulting luminous traces spread across the walls, ceiling and surrounding space. The room becomes part of the work, turning architecture into a surface of movement and apparition.

Touring information

Caustic Ballet is an indoor touring installation designed for darkened spaces.

The work requires surrounding walls and ceiling surfaces to receive the projected light traces. It can be adapted to white-box, galleries, industrial interiors and selected heritage spaces where light conditions can be controlled.
